### REC\_DS using C\_Week 7\_COD\_Question 4

Attempt : 1

Total Mark : 10

Marks Obtained : 10

### Section 1 : Coding

#### 1. Problem Statement

Develop a program using hashing to manage a fruit contest where each fruit is assigned a unique name and a corresponding score. The program should allow the organizer to input the number of fruits and their names with scores.

Then, it should enable them to check if a specific fruit, identified by its name, is part of the contest. If the fruit is registered, the program should display its score; otherwise, it should indicate that it is not included in the contest.

#### ***Input Format***

The first line consists of an integer N, representing the number of fruits in the contest.

The following N lines contain a string K and an integer V, separated by a space, representing the name and score of each fruit in the contest.

The last line consists of a string T, representing the name of the fruit to search for.

### **Output Format**

If T exists in the dictionary, print "Key "T" exists in the dictionary.".

If T does not exist in the dictionary, print "Key "T" does not exist in the dictionary.".

Refer to the sample outputs for the formatting specifications.

### **Sample Test Case**

Input: 2  
banana 2  
apple 1  
Banana

Output: Key "Banana" does not exist in the dictionary.

### **Answer**

```
#include <stdio.h>
#include <string.h>

#define MAX_FRUITS 15

typedef struct {
    char name[20];
    int score;
} Fruit;

void addFruit(Fruit fruits[], int *count, char name[], int score) {
    strcpy(fruits[*count].name, name);
    fruits[*count].score = score;
    (*count)++;
}
```

```

int findFruit(Fruit fruits[], int count, char name[]) {
    for (int i = 0; i < count; i++) {
        if (strcmp(fruits[i].name, name) == 0) {
            return fruits[i].score;
        }
    }
    return -1;
}

```

```

int main() {
    int N;
    scanf("%d", &N);

```

```

    Fruit fruits[MAX_FRUITS];
    int count = 0;

    for (int i = 0; i < N; i++) {
        char name[20];
        int score;
        scanf("%s %d", name, &score);
        addFruit(fruits, &count, name, score);
    }

```

```

    char searchKey[20];
    scanf("%s", searchKey);

```

```

    int result = findFruit(fruits, count, searchKey);
    if (result != -1) {
        printf("Key \"%s\" exists in the dictionary.\n", searchKey);
    } else {
        printf("Key \"%s\" does not exist in the dictionary.\n", searchKey);
    }

```

```

    return 0;
}

```

**Status :** Correct

**Marks :** 10/10
